/ucll line="BC-1; virally infected primary effusion lymphoma derived cell line"
| Jumphoma derived cell line" |
| Jumphoma derived con overlapping lambda phage and cosmid clones isolated from libraries; A prototype sequence for the terminal repeat (TR) unit is deposited under GenBank Accession Number U75699. The left junction variant TR sequence unit immediately preceding base pair of the LUR is deposited under GenBank Accession Number U7570. The remaining LUR sequence extending from this sequence to the right TR unit is not available due to difficulties in cloning and sequencing of this region"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Moore, P.S.

Kaposi's sarcoma-associated herpewirus glycoprotein M, DNA replication protein, glycoprotein, DNA replication protein, glycoprotein, DNA replication protein, glycoprotein, DNA replication protein, glycoprotein, DNA replication protein, protein and vcyclin genes, complete cds, and tegument protein gene, partial cds.

U93872. GI:14627174 Kaposi's sarcoma-associated herpesvirus encodes a functional cyclin J. Virol. 71 (3), 1984-1991 (1997) 3 (bases 123309 to 124082) Li, M., Lee, H., Yoon, D.W., Albrecht, J.C., Fleckenstein, B., Neipel, F. and Jung, J.U. (bases 122660 to 123226)
Thome, M., Schneider, P., Hofmann, K., Fickenscher, H., Meinl, E.,
Thome, M., Schneider, P., Hofmann, K., Bodmer, J. L., Schroter, M.,
Scaffidi, C., Krammer, P. H., Peter, M.E. and Tschopp, J.
Viral Filce-inhibitory proteins (Filps) prevent apoptosis induced Human herpesvirus 8 (Kaposi's Barcoma-associated herpesvirus - Human herpesvirus 8)
Human herpesvirus 8)
Human herpesvirus 8)
Viruses; debNA viruses, no RNA stage; Herpesviridae;
Gammaherpesvirinae; Rhadinovirus.
1 (bases 29032 to 30108; 117733 to 118431)
Zhong W., Wang.H., Herndier,B. and Ganem,D.
Restricted expression of Kaposi sarcoma-associated herpesvirus (human herpesvirus 8) genes in Kaposi sarcoma
Proc. Natl. Acad. Sci. U.S.A. 93 (13), 6641-6646 (1996) (bases 17242 to 17856)
Neipel,F., Albrecht,J.C., Ensser,A., Huang,Y.Q., Li,J.J.,Friedman-Kien,A.E. and Fleckenstein,B.
Human herpesvirus 8 encodes a homolog of interleukin-6
J. Virol. 71 (1), 839-842 (1997) by death receptors \_ \_ \_ Nature 386 (6624), 517-521 (1997) 97242415 5 (bases 1 to 133661) Neipel, F., Albrecht, J.C. J. Alkaline exonuclease, complement control protein homologue;

alkaline exonuclease; complement control protein homologue;

complete genome; cyclin homologue; DHR gene; dihydrofolate

reductase; DNA polymerase; duTPase; d pyrochein-coupled receptor

homologue; glycoprotein; glycoprotein B; glycoprotein H; helicase;

HVS.R transactivator; IE-G gene; integral membrane protein; major

capsid protein; major seDNA-binding protein; mCCPH gene;

ribonucleotide reductase, large subunit; ribonucleotide reductase;

small subunit; saimitit transformation-tassociated protein; mCCPH

gene; STP-All gene; thymidine kinase; tipomucleotide reductase;

DNA glucosidase.

Saimitine herpesvirus 2

Saimitine herpesvirus 2

Saimitine herpesvirus 2

Saimitine herpesvirus 2

Gammaherpesviruse; Rhadinovirus.

New rheaus rhadino virus for producing non-human primate model useful for testing potential treatments and efficacy of the candidate vaccine for conditions associated with RRV infection.

Claim 2; Page 83-122; 141pp; English.

The present invention describes a novel rhesus macaque rhadinovirus called macaca mulatta rhadinovirus 17577 (RRV). AAC64754 represents the RRV genome sequence, and AAB531213 to AAB53204 represent the proteins encoded by the genome sequence. The present invention also specifically claims the individual open reading frame (ORF) nucleotide sequences from the genome which encode the individual proteins, but these sequences are not given. A non-human animal infected with RRV can be used for testing the efficacy of drug in the treatment of condition associated with infection with RRV sunch as Kaposi's sarcoma, lymphoptoliferative disorders, B-cell hyperplasia, lymphoptoliferative by confiscerion with RRV sunch as Kaposi's sarcoma, lymphoptoliferative disorders, B-cell hyperplasia, lymphoptoliferative by confiscerion with stering the drug to a immuno-compromised non-human primate preferably Rhesus macaque monkey obtained by as a result of infection by simian Immunodeficiency Virus (SIV). RRV is useful for producing non-human primate model for testing potential treatments for conditions associated with RRV infection. It is also useful for testing the efficacy of the candidate vaccine by administering the vaccine to the subject capable of infection with RRV incollating the subject with RRV incollating the subject with RRV incollating the subject with RRV incollating the subject with RRV incollating the subject with RRV incollating the subject with RRV incollating the subject with RRV incollating the effect of vaccine. Used in the exemplification of the present invention

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). XSHV is also known as human herpes virus (HHV9). This sequence contains the DNAs of the invention which encode KSHV polypetides selected from: (a) viral and complement-binding protein; glycoproteins B, Mor L; (c) viral lart; (d) complement-binding protein; glycoproteins B, Mor L; (d) capsid protein; V encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the proteins are useful for complements (AB) specific of the proteins are useful for cherecting HNV8, specifically for dagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHV8 infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein can be used for prophylaxis or treatment of HHV8 infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHV8 may be implicated in many other lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the used as targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methotrexate. These can also be used to determine viral MNP III may be used as an anti-inflammatory agent for, e.g. the immune status of a patient infected with HNV HNV expected protein viral MNP III may be used as an anti-inflammatory agent for, e.g. the attent of a patient infected with HNV HNV expected protein viral MNP III may be used as an anti-inflammatory agent for, e.g. the attent of a patient infected with HNV HNV expected protein viral MNP III may be used as an anti-inflammatory agent for, e.g. open reading frames. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             64892 ATGGACAĞCTCGGAAĞGTĞCACTGATATGĞACĞAĞCCQAGCCCGĞGTTCATCCTCAAC 64951

Disclosure; 

This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains conding regions for ORP20, ORP21, Mbich encodes thymidine kinase, ORP22 which encodes glycoprotein H, ORP23, ORP24, ORP25, which encodes packaging protein II, ORP27, ORP38, ORP39 which encodes packaging protein II, ORP30, ORP31, ORP32, ORP33, ORP39 which encodes packaging protein II, ORF34, ORF36 which encodes allvaline exomuclease, ORP39 which encodes glycoprotein M, ORF40 which encodes elicase primase subunit II, ORF41 which encodes allvaline exomuclease, ORP39, ORF39 which encodes allvaline exomuclease, ORP34, ORF43 which encodes allvaline exomuclease primase subunit II, ORF41 which encodes helicase primase subunit II, ORF41 which encodes helicase primase subunit II, ORF44 which encodes allvaline exomuclease the virion assembly protein, ORF46 which encodes uracil DNA glycosylase (UD3), ORF47 which encodes glycoprotein I. KSHV is a new human Herpesvirus (HHV8) believed to courring in persons with acquired immune deficiency syndrome (ADD3). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and concurrent of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's sarcoma in a cell. (Updated on I7 correction of the property of the protein of the protein of the property of the protein of the

Kaposi's sarcoma-associated herpes virus nucleic acid - encodes di.hydro:folate reductase and is useful for treatment, prophylaxis or diagnosis of Kaposi's sarcoma.

Disclosure; Col 125-156; 109pp; English

```
This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHY) LUR (long unique region). This fragment contains coding regions for ORF48, ORF49, ORF50 which encodes a transactivator (LCTP), K8, ORF52, ORF54, ORF56 which encodes durpase, ORF55, ORF56 which encodes Immediated early protein II (IEP-II), K9 which encodes UNF81 (ICSBP), K10, K11, ORF58 which encodes Immediated early protein II (DRF60 which encodes DNA replication protein, ORF59 which encodes DNA replication protein of protein II, ORF60 which encodes a small ribonucleotide reductase, ORF61 which encodes a large ribonucleotide reductase, ORF62 which encodes as seembly/DNA maturation protein II. KSHV is a new human Herpesvirus (HFV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AlDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's sarcoma in a cell. (Updated on 17-OCT-2003 to standardise OS field)

This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2246), is designated Contig ID 1, and encodes 6 HSV-2 proteins The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Herpes simplex virus type-2 sequences - useful in, e.g. prevention and treatment of infection or inducing immunological response in mammal.

The invention relates to a composition comprising an expression vector bound to an aggregated protein-polycationic polymer conflugate or suspension. The expression vector contains a promoter polymuclectide sequence operatively linked to a polymuclectide sequence encoding an antigen which is a fragment of a gene or genome associated with an confectious disease, cancer and autoimmune disease such as rheamstoid arbitis, vasculitis, and multiple sclerosis, pathogenic genomes consisting of bacterium, fungus, protozoa and virus such as human confecticiency virus (HIV), herpes simplex virus (HSV), hepatitis C virus (HCV), influenza and respiratory syncytial virus (HSV), hepatitis C virus (HCV), influenza and respiratory syncytial virus (HSV), and c c cytokine expression vector), is useful for inducing an immune response (systemic and/or mucosal) in an organism. The cytokine expression vector or granulocyte macrophage-colony stimulating factor contains a sequence for granulocyte macrophage-colony stimulating factor contains a sequence for granulocyte macrophage-colony stimulating factor contains and the cytokine are under transcriptional control of same or different promoter polymuclectide sequences. The expression vector, as a condition in an organism. The present sequence is human herpesvirus 2 complete DNA genome related to the invention Composition for oral delivery of vaccines, comprises expression vector containing antigenic genomic sequence, bound to aggregated protein-polycationic polymer conjugate or suspension. This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SBS (deposited as ATCC VR-2546), is designated Contig ID 100, and encodes 6 HSV-2 procesins. The protesins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the protesins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological Herpes simplex virus type-2 sequences - useful in, e.g. prevention and treatment of infection or inducing immunological response in mammal. 2097 CAACATTATCGTCATCGACGAGGCCGGGCTCCTGGGGCCGGCACCTACTACTCACGACCGTGGT CAATATTATTGTAATCGACGAGGCCGGAACCCTGTCCTCTTACATACTCACCACCGTCGT WPI; 1998-286847/25. The specification describes a method for the quality control of an attenuated pox vaccine, characterised in that the DNA sequence of specific parts of the viral genome in a sample is determined and proved to be conserved rather than mutated in comparison with the same parts of a reference viral genome. The method is useful for quality specific positions of of attenuated live varicella 125 CTTTACCTGTCCCGTGGTGTGCGAGGTGTTTGAAGCCGTTTGAGGAATACAAGCGGGC 2634 GTTTACCCTCCCCGTGCTTACGTTTGTGTCGGTCAAAGAGTTTGACAAGTATCGACGCT TAATTATTCGCAGTTTGTGGACCAGGACATGTCCATAGTCGCCACGCAATC-----CAC 2754 CAACTACTCCCAGAGTCAGGACCAGGACGCGGGGCACGTGCGCTGTGAGGTGCACAA 2874 GACCGCGCCTCCGAAAGATGGTGTTTGGGTTCGACGGGACGTTTCGGACCTTTCGAGGC 1419 AATCCTAGACGGGAACTCTTCGTGGAGACGCATTCGCAAGACCGTCCGGAATACGTATA GTATCTAACAAACCTACACACATGTCTAACGCTAGGGGGGGATACCAGGGACACGAAGCT 1299 IGAACGITCGACCCAGGITACCITTATCACCAAGITTGITTAAAAACAGCCACGIGTCTTT 2577 gracarosccaascrccacsccraccraascrosccacs --- Googearrrerrer 2814 GCAACAGCTAGTCGTGGCCCGGAACGACATCACGTACGTCCTCAACAGCCAGGTCGCGGT Oka strain; pox vaccine; vaccine; poxvírus disease; chickenpox; ss. 1479 CGGTTTCTTAAACACGCTACTGTACAACGCCATGTACTCGTTTCAC 1524 2994 ccesricererecesciercarsiresecescestrareacririae 3039 Nucleotide sequence of the Varicella virus Oka strain ¥ Yamanishi Method for checking absence of mutation at varicella virus genome for quality control Disclosure, Page 106-150, 158pp; Japanese. The present sequence represents the human cytomegalovirus (HCNV) ULLOS per reading frame (orf) spanning nucleotides 151926 through 154793 of HCNV AD169 which was amplified by PCR primers AAT85074-5. The amplified product was digested with Bgill and BCORI and cloned into Bgill/EcoRI adjested appears vector DNA to yield the plasmid pBB9T7 ULLOS. The amplified amplified HCNV ULLOS orf sequence and it translational product were determined. The HCNV ULLOS orf was recombined into the baculovirus ACNPV genome by standard co-transfection protocols. The invention relates to a new human cytomegalovirus (HCNV) primase. A screening assay for compounds which inhibit HMCV primase (preferably with an ICSO of not greater than 900M). Comprises incubation of the compound with the primase. The primase of the invention is useful as a screening tool for HCNV intitions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1065 caadcorridcaccordeacrirredcoaccrecrecrearacardaadrresgrafeed 1124

The amplified product was digested with EglII and EcoRI and cloned into BglII/RecRI digested pBBT7 vector DNA to yield the plasmid DB877 UL105. The amplified HCMV UL105 orf sequence and it translational product, helicase, were determined. The HCMV UL105 orf was recombined into the bacanlovirus ACMPV genome by standard co-transfection protocols. This new HCMV helicase is used in a screening assay for compounds which inhibit HMCV helicase (preferably with an ICSO of not greater than 200mM), and as a diagnostic tool for

Also described is a composition suitable for use as a vaccine comprising the isolated recombinant DNA molecule and an excipient. The YAC has antiinflammatory, immunosuppressive, virucide, and hepatotropic activities, and can be used in vaccine production. The YAC vector and the recombinant DNA molecule are useful as vaccines for treating infections caused by CMV, e.g. congenital infections such as jaundice, respiratory distress and convulsive seizures, which may result in mental retardation, neurologic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytomegalovirus-yeast artificial chromosome (CMV-YAC) DNA molecule useful as a vaccine for treating CMV infections e.g. jaundice, respiratory distress, convulsive seizures, mononucleosis, hepatitis, pneumonitis and

                                                                                                                                                                                                пd
                                                                                                                                                                                                                                                                                                             The specification describes a method of treating cancer or hyperproliferative disorders. The method comprises administering a conditionally replicative viral vector, where at least one of the viral nucleic acids encoding a product sesential for its replication is operably linked to an H19 regulatory sequence. The method is useful for treating cancer or hyperproliferative disorders. The cancer is selected from many different types, for example, carcinoma, sarcoma, adenoma and ganglioblastoma. Preferably, the cancer is bladder carcinoma. The presents equence represents the CMV immediate early region transcript. It may be used to produce vectors for use in the method of the invention
                                                                                                                                                                                       Treating cancer or hyperproliferative disorder comprises administering conditionally replicative viral vector, where the viral nucleic acid encoding a product essential for its replication is operably linked to H19 regulatory sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1124
                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1304
disability or death, or asymptomatic adult infections such as mononucleodis, hepatitis, pneumonitis and retinities. The vaccine can also be used for immuno-compromised patients suffering from acquired immune deficiency syndrome (ADDS), or undergoing chemotherapy or tissue rejection therapy after organ transplantation. The vector is also useful as a tool for studying the replication of CMV using cell-line models and the function of essential cis acting genes or nucleic acid sequences. The YAC vector provides an ease and rappldity in introducing single or multiple mutations into a CMV DNA sequence. The capacity of the vectors to generate multiple mutations exceeds the capacity of other vectors to generate multiple mutations screens the present sequence represents human cytomegalovirus strain AD169 genomic sequence (also see Genbank X17403.1), given in the present invention
                                                                                                                                                                                                                                                                                                                                                  644
                                                                                                                                                                                                                                                                                                                                                                                                                  704

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents the nucleotide sequence of Varicella virus, Dumas strain. The specification describes a method for the quality control of an attenuated pox vaccine, characterised in that the DNA sequence of specific parts of the viral genome in a sample is determined and proved to be conserved rather than mutated in comparison with the same parts of a reference viral genome. The method is useful for quality control of vaccines for use in the prevention of poxvirus diseases such
